QA Automation — Practical Assessment

This is the practical part of our process. It's open-ended on purpose. We'd rather see how you approach a problem than check whether you followed a checklist. Spend about a day of focused effort on it. You have **3 days** to submit.

The application

EventHub is a ticket-booking platform with a web UI and a REST API.

- Web app: https://eventhub.rahulshettyacademy.com
- API docs: EventHub API Docs

Register your own account(s). It's a shared public environment, so please clean up any data you create.

The flow

We'd like you to focus on one flow: **booking tickets for an event**.

The user story

Our Product Owner handed this story to the team:

> **US-114: Book tickets for an event**
>
> **As a** visitor to EventHub
> **I want to** book tickets for an event
> **So that** I can attend it.
>
> **Acceptance Criteria**
>
> - **AC1** — When I choose the number of tickets, enter my name, email and phone, and click *Confirm Booking*, my booking is created and I see a confirmation with a booking reference.
> - **AC2** — The total price is the ticket price multiplied by the number of tickets.
> - **AC3** — The booking appears in *My Bookings*.
> - **AC4** — I can cancel a booking.
> - **AC5** — The same works through the API using `POST /api/bookings`.

What we'd like from you

1. **Review the story.** In your README, note what's missing, unclear, or wrong in it, and what you'd ask the Product Owner. If anything you see in the application doesn't match the story or

the docs, write it up.

2. **Build UI and API automation for the flow.** Use **Playwright**, or **Playwright (TypeScript) + RestAssured (Java)**. The choice is yours.

   The architecture matters most to us. **The framework should be able to grow over time.** Build it as if a team will keep adding to it for the next couple of years. **Authorization must be handled by the framework, not by individual tests.**

   It's up to you how many tests to write and what to cover. Tell us why you made those choices.

⭐ Bonus (optional)

If you have time, add a **GitHub Actions** workflow that runs your tests on every push.

What to send back

Submit your work through this form: **Practical Assessment Submission**

Include a link to a Git repository we can access, containing:

- your code
- a README that explains how to run it, your story review, your key decisions, and what you'd do with more time

Please also provide any credentials we need to run your tests.

A few notes

- You can use AI tools. Be ready to explain anything you submit.
- If something is unclear, make a sensible assumption, write it down, and keep going.

Good luck, and we look forward to talking it through with you.
